VPC module

Build the terraform module to deploy VPC
Done and checked on AWS.

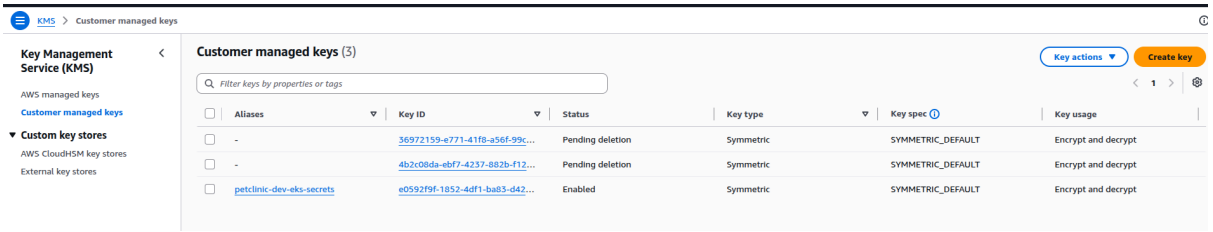

EKS module

Build the terraform module to deploy EKS
Login with user terraform to see the kubernetes cluster and nodes.
Done and checked on AWS

KMS

ECR module

Build the terraform module to deploy ECR.

Build images
Install Java 17
I needed to use Maven.
On Ubuntu/Debian:

```
sudo apt update
sudo apt install openjdk-17-jdk
```

Verify the Installation

```
java -version
```

You should see output like:

```
openjdk version "17.0.x" ...
```

Also, you need to have Docker (I installed it in the beginning of this project)

I run /terraform-plan dev
(54 resources)

Then, I run /terraform-apply plan-out (it's a skill of claude, in this case, I use Cline)

It's take a long time, 30 minutes approximately.

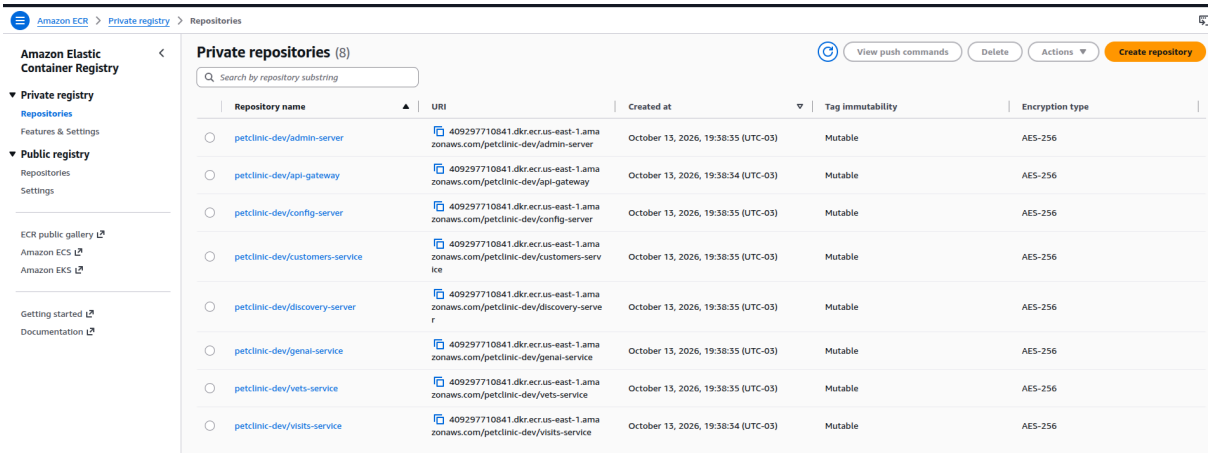

Make the images:
$ chmod +x ecr-login.sh
$ ./ecr-login.sh

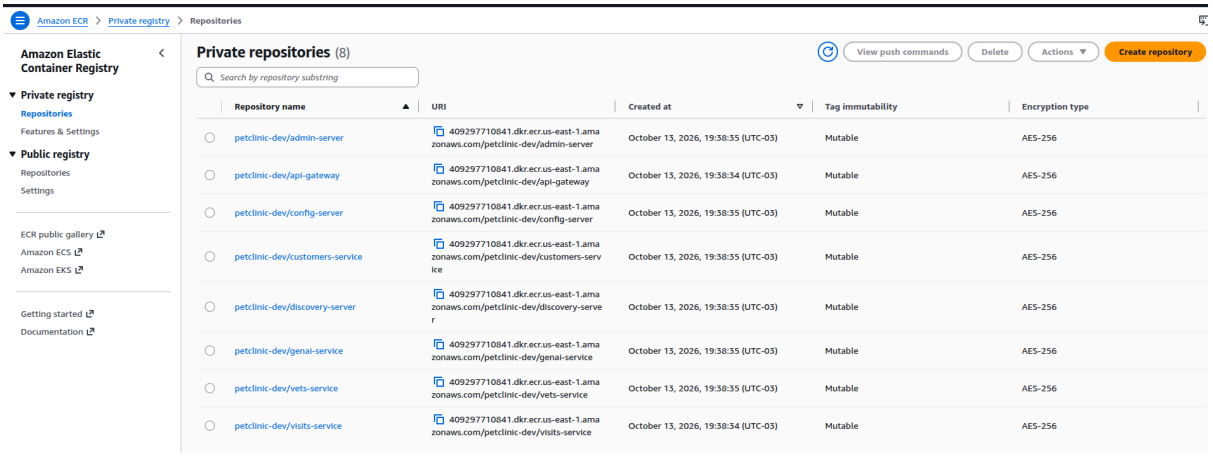

$ ./build-push-images.sh

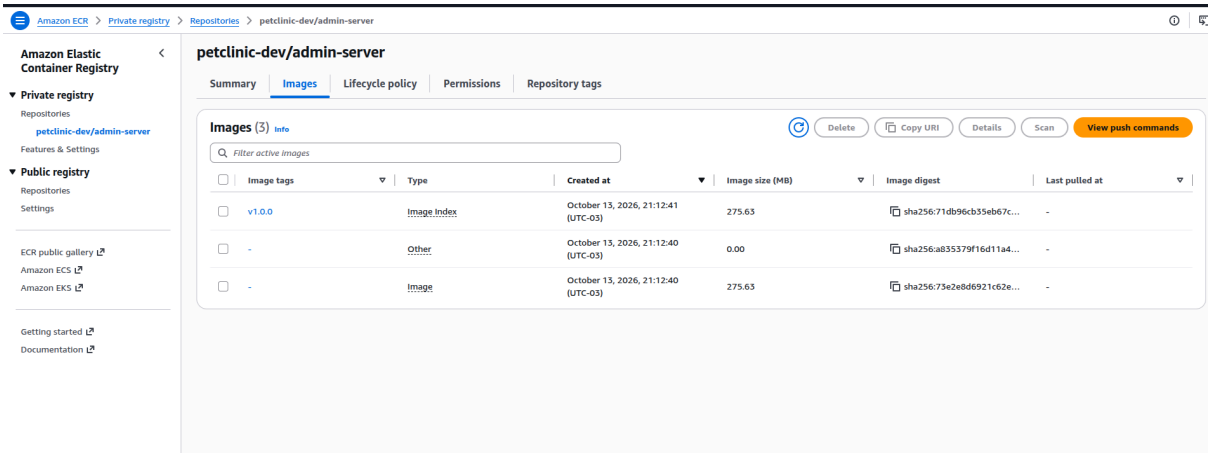

ISSUES
Sometimes, I see that the AI must do a re-apply and it's generate duplicate resources. (ONE PROBLEM TO SOLVE). Also, it's generate a lock of the terraform state (dynamodb table)

Another problem is the KMS duplicate, why? Because I destroy every day all the resources, but the KMS still exist.

Done and checked on AWS.

Every day I will destroy the EKS module to save money.

$ terraform plan -destroy -target module.eks -out detroit.plan
$ terraform destroy destroy.plan

It takes a while.

—----------

Next step -> RDS module 🙂
